## Adventure Works Sales & Margin Analysis (2015-17)

The first page of the dashboard provides a comprehensive overview of **sales and profitability performance** from 2015 to 2017. It is designed to give executives a clear, top-down view of revenue, costs, margins, and units sold, while also enabling drilldowns into categories, territories, and products.

At the top, **KPI cards** summarize the business at a glance:

- **Revenue** and **Cost** highlight the scale of operations
- **Gross Margin** and **Gross Margin %** measure profitability
- **Units Sold** reflects overall sales volume

Together, these KPIs establish the baseline for deeper analysis.

The **monthly trend chart** combines revenue bars with a margin percentage line, showing how profitability has remained consistent while revenue fluctuates seasonally. This dual view helps identify months of peak sales and assess whether margins held steady during growth periods.

The **category breakdown chart** compares revenue across Accessories, Components, Bikes, and Clothing. This visual makes it clear which product segments drive the majority of revenue, guiding strategic focus on high-performing categories.

The **territory map** highlights regional performance, showing revenue distribution and margin percentages across continents. This geographic view helps identify strong markets and regions where profitability may need improvement.

Finally, the **matrix table** provides a detailed drilldown by product and year, listing revenue, cost, and margin side by side. This granular view supports product-level decision making, such as identifying high-margin items or products with rising costs.

**Interactive slicers** on the left allow filtering by year, month, category, and territory, making the dashboard flexible for different stakeholder needs.

Together, Page 1 transforms raw sales data into a clear narrative of business performance, enabling leaders to track growth, monitor profitability, and prioritize focus areas for sustained success.

This dashboard page explores the **customer experience side of the business**, focusing on product returns and complaints from 2015 to 2017. It helps uncover which products, categories, and regions are most affected — enabling targeted improvements in quality and service.

At the top, **KPI cards** summarize key metrics:

- **Total Return Quantity** shows the overall volume of returned items
- **Return Rate %** compares returns against total units sold, revealing that returns are minimal relative to sales
- **Max Return Quantity** highlights the highest number of returns for a single product, helping isolate outliers

The **bar chart** breaks down returns by product category, showing that **Components and Accessories** are the most returned segments. This insight guides product teams to investigate design, durability, or packaging issues in those categories.

The **Products & Returns Table** provides a detailed view of individual products and their return counts. For example, the **LL Mountain Frame - Silver, 52** and **LL Mountain Frame - Black, 48** top the list, indicating potential quality or fit concerns. This granular data supports root-cause analysis and targeted corrective actions.

The **territory map** visualizes return activity across global regions, with hotspots in **North America, Europe, and Australia**. This geographic view helps regional managers assess whether returns are driven by local market expectations, shipping issues, or product mismatches.

On the left, a clean **filter panel** allows users to slice the data by **Year, Category, and Country**, making the dashboard interactive and adaptable to different stakeholder needs.

Together, this page transforms return data into actionable insights, helping the business reduce product issues, improve customer satisfaction, and optimize regional strategies.
